Design your own DRONE

Farmers use drones all the time to spray crops with water or fertiliser, which is much quicker than doing it by hand. They can even check to see where the cows and sheep are, and what parts of the farm the animals like to hang out in the most! Farmers can scan their crops to see if any patches need special attention.

Your task is to draw a new type of agricultural drone to help a farmer on their farm. You can make anything!

You might like to think about how drones help farmers use their time well and see things from the air that would give them a better perspective of their farm.

Royal Agricultural Society of NSW

DRONE DESIGN

Brainstorm and draw your idea! Think of things a farmer could do from the sky that would help out on the farm. Cameras, lasers, spraying equipment, pellet droppers, bird scarers, transport boxes and anything else you can think of can be attached to a drone!

Don't be afraid to ask for help, we'll give you some cool ideas!
